Pacific herring, Prince Rupert District

DFO's 2024 Sustainability Survey for Fisheries places this stock in the **Healthy** zone (method recorded: scientific peer review process). In 2018, the last year of the assessment series in RAM Legacy, estimated biomass was 1.36 times the limit reference point used in this project, which is above the limit. Between 1951 and 2018, biomass was below the limit in 25 of 68 years. The lowest value was 0.44 times the limit, in 1968.

Item	Detail
Species	Pacific herring
DFO 2024 status zone	Healthy
Data tier	C: Biomass and catch trends, no MSY ratios
Latest biomass / limit	1.36× (2018)
Assessment years	1949-2018
Managed by	Fisheries and Oceans Canada (DFO)
Management plan	2023/24 Pacific Herring IFMP - November 7, 2023 - November 6, 2024

Management context

- **Limit reference point, as described by DFO:** 0.3SBo (unfished spawning biomass) or 17,640 tonnes* (estimates are updated annually) *value reported from the 2023 stock assessment, implemented for 2023/24 fishery

- **Upper stock reference, as described by DFO:** Implementation of USRs occurred through the 2023/24 Pacific Herring IFMP. For the PRD stock, the USR for was set at the average spawning biomass during the productive period (1983-1992). Provisional USRs are considered spawning biomass objectives in the MSE process and are not considered equivalent to the upper control point of the harvest control rule.
- **Limit used for this project's indicator:** 0.3 x unfished spawning biomass (SSB0 from the 2018 assessment in RAM)
- **Management plan:** 2023/24 Pacific Herring IFMP - November 7, 2023 - November 6, 2024
- **Managed by:** Fisheries and Oceans Canada (DFO)

Data gaps and uncertainty

- Time series ends in 2018; the DFO zone is from the 2024 survey.
- No fishing-pressure ratio relative to MSY, so no Kobe plot.
- Limit reference point taken or derived from RAM Legacy; DFO's current value may differ.

There are no MSY-based ratios for this stock in RAM Legacy. Status is judged against a limit based on unfished spawning biomass, which DFO re-estimates each year. Model uncertainty is not shown here.
